

Lake Assessment – December 2023

Lake 1: Small Lake

At the time of my visit in December the lake was milky, slightly green looking again this month. OK. A lot of geese continue visiting the lake. Nutrient levels were high for phosphorous, possibly caused by the large number of geese.

Lake 2: Large Middle Lake

At the time of my visit the lake was slightly milky clear looking. Slight tint of brown; OK. Although nutrient levels were low last month phosphorous levels were extremely high, again likely do to the large number of geese frequenting the lake.

Lake 3:

At the time of my visit Lake Superior was milky slightly greenish looking; OK. Nutrient levels were low for phosphorous in this lake in December. Nitrogen continues to remain high.
